

Development of 2°C compatible investment criteria

Lutz Weischer,
Team Leader International Climate Policy, Germanwatch

28 March 2017, Bonn

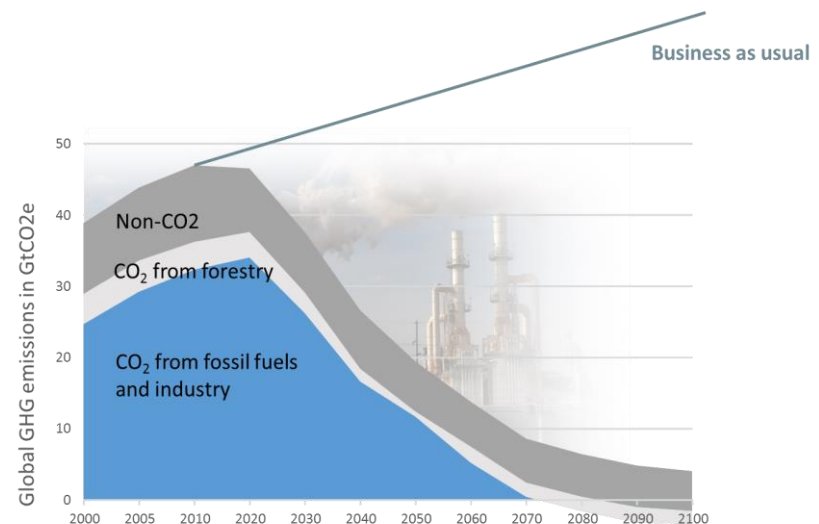

Study commissioned by German G7 Presidency 2015

Authors: Niklas Höhne, Frauke Röser, Markus Hagemann, Lutz Weischer, Alexander El Alaoui, Christoph Bals, David Eckstein, Sönke Kreft, Jakob Thoma, Morten Rossé

Why did we study 2°C investing criteria?

- » 2°C requires step change in investments towards zero emissions
- » Misguided investments will lock in greenhouse gas emissions for decades
- » Development banks and similar financial institutions often incorporate climate into their investment decisions but rarely link these to temperature limits

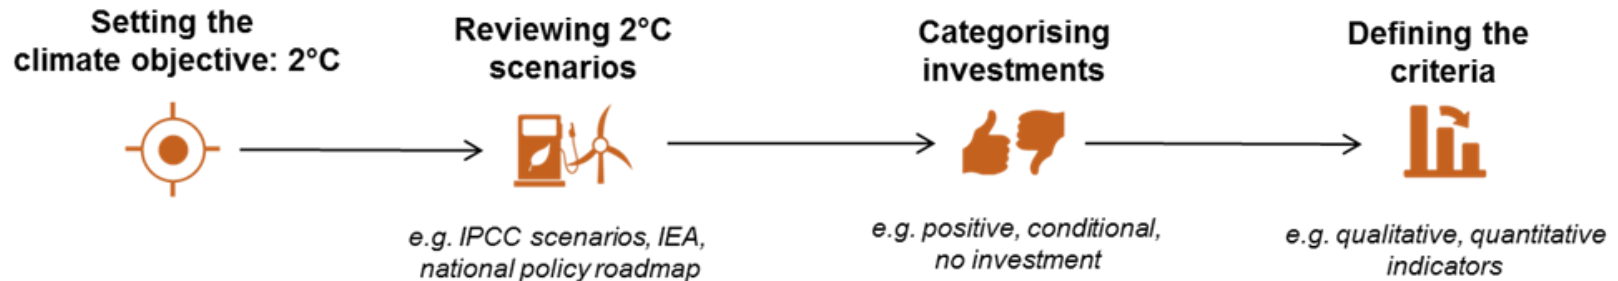

Source: Illustrative 2°C scenario, based on marker scenario RCP 2.6 of the IPCC, from RCP scenario database

What does the Paris Agreement mean for 2°C investing criteria?

- » Paris reinforces need for criteria:
 - » Article 2.1 (c): "Making finance flows consistent..."
- » Paris necessitates a review of our criteria:
 - » "well below 2°C/1.5°C"
 - » focus on "increasing the ability to adapt"

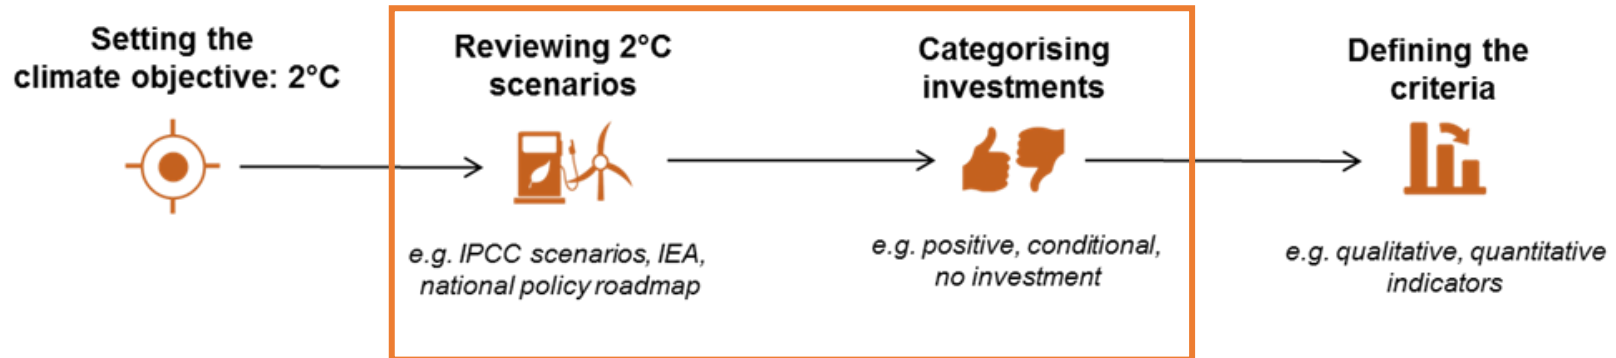

Approach

- » Challenge: translate global goal to individual project
- » Systematic review of different 2°C scenarios to determine where investments should/should not flow
- » Categorise investments based on consistency across scenarios

Approach

- » Challenge: translate global goal to individual project
- » Systematic review of different 2°C scenarios to determine where investments should/should not flow
- » Categorise investments based on consistency across scenarios

Review of 2°C scenarios

- » Comprehensive review of 2°C compatible model scenarios
 - » Scenarios from Integrated Assessment Models (e.g. as in IPCC report)
 - » Energy sector models (e.g. IEA)
 - » Renewables and efficiency scenarios (WWF and Greenpeace)
 - » Sector specific scenarios
- » Elements assessed:

Contribution to emission reductions	Asset lock in risk	Value of future investments	Regional hotspots
Describes where most emission reductions are needed under 2°C scenarios	Describes the lock in potential of the technology considering <ul style="list-style-type: none">• lifetime• value of investment Includes negative carbon lock-in but also positive lock-in in climate friendly technologies	Describes where investments needs to flow, according to available 2°C scenarios	Region / sector combinations where the major reductions are necessary

Results – Example energy supply

Investment options	Emission reductions		Asset lock-in risk (positive and negative)	Future investments		Regional hotspots	Positive investment	Conditional investment	Controversial investment	No investment	Priority for this project	
	% emission reductions total	Role under 2°C scenarios		Per Sector	Per Individ. Option							
Renewables	29% 65%	High	Medium	High	High	China, United States, India	??	??	??	??	?	
Coal		Low-Medium	Medium-high		Low-Medium		??	??	??	??	??	?
Natural Gas		Low-Medium	Medium		Low-Medium		??	??	??	??	??	?
Bioenergy/CCS		Low-Medium	Medium		Low-Medium		??	??	??	??	??	?
Nuclear		Low-Medium	Medium-High		Low-Medium		??	??	??	??	??	?
Energy transmission infrastructure		??	High		Medium-High		??	??	??	??	??	?
Energy storage		??	Medium-High		Medium		??	??	??	??	??	?
Energy supply manufacturing		??	High				??	??	??	??	??	?
Biofuels feedstock		??	Low				??	??	??	??	??	?
Fossil fuel production		??	Medium				??	??	??	??	??	?

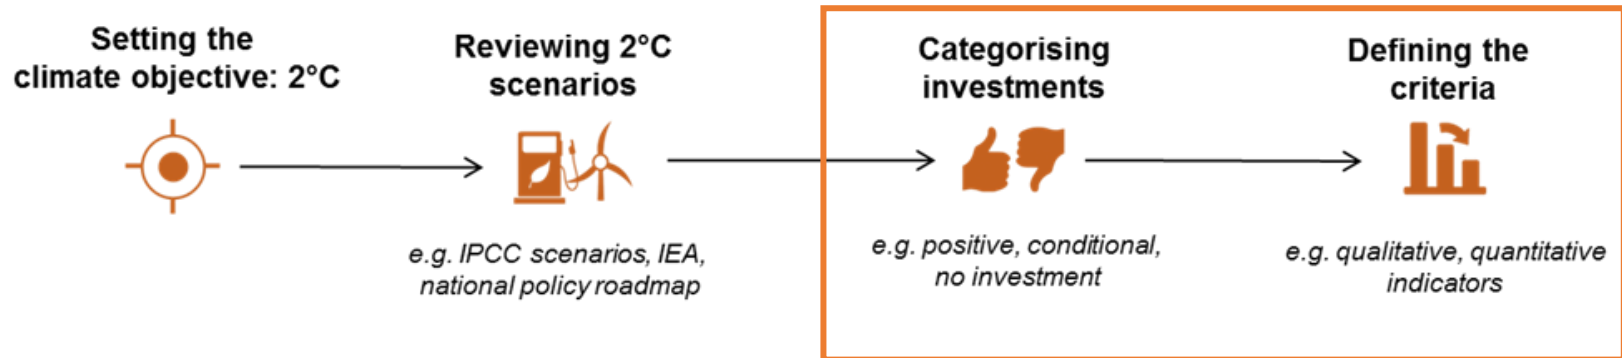

Categories of investment areas

2°C Compatible	Conditional	Ambiguous	Misaligned
Fully aligned with 2°C consistently over all scenarios	2°C aligned only under certain conditions in all scenarios <ul style="list-style-type: none">• Due to the fact that multiple pathways can lead to 2°C (e.g. more renewables and less efficiency or the other way around)• Due to different assumptions on technological development• Due to considerations of other sustainability factors	2°C aligned in some scenarios, but not in others	Consistently misaligned with 2°C in all scenarios

Categories of investment areas

2°C compatible	Conditional	Ambiguous	Misaligned
Fully aligned with 2°C consistently across all scenarios	2°C aligned only under certain conditions in all scenarios	2°C aligned in some scenarios, but not in others	Consistently misaligned with 2°C in all scenarios
	<ul style="list-style-type: none"> • Due to the fact that multiple pathways can lead to 2°C (e.g. more renewables and less efficiency or the other way around) • Due to different assumptions on technological development • Due to considerations of other sustainability factors 		
<ul style="list-style-type: none"> • Renewable energy • Energy storage • Low carbon transport fuel infrastructure • Low carbon vehicles 	<ul style="list-style-type: none"> • Gas fired power plants • Energy transmission and distribution infrastructure • Energy efficiency in heating and cooling of buildings • Efficiency in industry • Transport infrastructure • Transport efficiency • Agriculture and forestry • Building appliances 	<ul style="list-style-type: none"> • Biofuels • Fossil fuel production • Large hydropower • Bio energy carbon capture and storage • Nuclear 	<ul style="list-style-type: none"> • New coal fired power plants with unabated emissions over their lifetime
			Based on a comprehensive review of 2°C compatible model scenarios, including scenarios from Integrated Assessment Models (e.g. as in IPCC report), energy sector models (e.g. IEA), renewables and efficiency scenarios and sector specific scenarios.

Approach

- » Challenge: translate global goal to individual project
- » Systematic review of different 2°C scenarios to determine where investments should/should not flow
- » Categorise investments based on consistency across scenarios

Suggestions for criteria based on categorization

- » 2°C investment criteria for individual projects ...
 - » Can be developed from 2°C compatible global model scenarios
 - » Have to be sector specific
 - » Need to strike a balance between complexity and manageability
 - » Need to also consider the overall portfolio
 - » May vary across geographies
- » 2° investing criteria for physical assets can take the form of
 - » Positive / negative list (e.g. solar PV is always 2°C compatible)
 - » Qualitative conditions (e.g. be integrated in a larger climate strategy)
 - » Quantitative conditions (e.g. energy use per floor space)
- » Use of 2°C investment criteria can be integrated in the decision making processes of international financial institutions
- » Criteria are also needed to align financial flows with climate-resilient development and improve adaptive capacity of communities

Integrating criteria in decision making processes

Regular project evaluation

Additional questions on 2°C compatibility

Preliminary screening

- Within the bank's priority sectors ?
- ...

- For development banks: on negative list?
- For dedicated climate funds: on positive list?

Economic evaluation

- Is the project viable?
- Not crowding out private finance?
- ...

- Project viable with shadow carbon price?

Development evaluation

- Does project promote development, in line with country strategy/needs?

ESG evaluation

- Are any environmental, social or governance issues associated with the project?

- Does project meet qual/quant benchmarks?
- Does project fulfil existing standards deemed to be 2°C compatible?
- Is project consistent with national 2°C strategy
- ...

Overall Bank strategies

Sector policies

Country frameworks

Guidance for individual project types

2°C criteria for the power sector

2°C compatible	Conditional / ambiguous		Misaligned
<p>Preliminary screening:</p> <p>Energy source: Wind PV Small hydro</p>	<p>Economic evaluation:</p> <p>Energy source: e.g. natural gas</p> <p>Shadow economic price of carbon</p>	<p>ESG evaluation:</p> <p>Energy source: e.g. natural gas</p> <p>Decarbonisation based approach.</p> <p><i>Simple:</i> Prove that project fits into a path towards 0 gCO₂/kWh in 2050</p> <p><i>Advanced:</i> Prove that the project fits into a national sector-based decarbonisation strategy including lifetime, operation mode and capacity requirements</p>	<p>Preliminary screening:</p> <p>Energy source: New coal fired power plants with unabated emissions over their lifetime</p>

Next steps

- » Further research is needed to
 - » a) align with 1.5°C
 - » b) attempt to clarify projects in "ambiguous" category
 - » c) develop criteria for climate-resilience
- » Financial institutions may choose to respond in different ways to the fact that for some individual projects there is a higher certainty that they are 2°C compatible than for others - in addition to criteria for individual projects, portfolio-wide strategies and objectives might be useful
- » A coalition of “early adopters” could be formed bringing together interested bilateral development banks and governments:
 - » Support and accelerate the development of criteria in sectors
 - » Road test the proposed criteria

Question and Comments?
